Known outside of North America as the Canon EOS 750D and EOS 760D Rebel T6i and T6s, respectively, the latter, equipped with a topplate LCD and control dial on the rear, is aimed at more serious users. Both models, however, use the same new 24 Mpix APSC CMOS sensor with a lowpass filter and feature Canon's Hybrid CMOS AF III system. This elaborate sound system supplements contrastdetection AF with sensorbased phasedetection points for faster, more responsive AF when the mirror is up during live view and video capture. As a camera aimed at the more advanced user, the EOS 760D adds Servo AF in liveview mode, allowing the AF system to track subjects during liveview operation. Choosing lenses for the two models is a somewhat complicated affair, particularly if wanting to use fixedfocallength lenses. Canon, like many manufacturers, doesn't offer a complete range of primes designed specifically for APSC models. Instead, the expectation is to choose either full frame lenses, or opt for a zoom. While there are a proliferation of zooms made for APSC, choosing a fullframe zoom or prime often means paying more for a lens that's designed with a wider field of view and often for a different purpose. Although this isn't limited to Canon, the company is updating its older, more accessiblypriced fixedfocallength models with newer higherend lenses aimed at enthusiasts. As a result,there are a number of pricey models from Canon, but accessiblypriced options are available from third parties such as from Sigma and Samyang, especially.

The Samyang lacks electronic coupling, so the lens must be stopped down manually. And there's no data shared between the camera and lens.Despite that, the Zeiss 15mm 2.8 model is an outstanding performer, even if it's beyond the reach of the intended market of the cameras.Optical performance is unusually good, given the price, but distortion is high, and given that it borders on complextype, it is difficult to correct. Despite the lack of accessiblypriced models or perhaps because of it, there are some excellent performers. In third place is another model from a third party that challenges Canon's welldeserved reputation as a premium lens maker. When it arrives, we fully expect it to be on par with the Sigma in quality and most likely in price as well. Most of the gains over the Sigma are in the outer field, at least at wider apertures. In the lab the Sigma, surprisingly, has less lateral chromatic aberration, but anything below 10 microns is considered low anyway. With a slightly longer focal length.The 40mm and 100mm can also be easily recommended. Read more about our Comment Policy.
